# **Shoulder Dystocia**

## **Participant Resource Kit**

## Maternity Education Program

The resources developed for Maternity Education Program (MEP) are designed for use in any Queensland Health facility that care for patients/ women who are pregnant/ birthing or postnatal.

Developed by Sue Hampton, Midwifery Educator – Clinical Skills Development Service, MNHHS,  
Dr Belinda Lowe, Obstetrician & Gynaecologist – Gold Coast University Hospital

Reviewed by Debbie McConnel, Timothy Hasted, Susan Lawton, Lynne Buetow, Janene Rattray,  
Rebecca Rooney, Jodi Bunn, Rachel Hentzschel

3D animation developed by Peter Thomas, 3D Interactive Specialist – Clinical Skills  
Development Service (CSDS)

## **Who is this resource kit for?**

This resource kit provides healthcare workers with knowledge and skills on assessing and managing a shoulder dystocia.

### **Target audience**

Midwifery and medical staff providing maternity care

### **Duration**

45 mins – including simulation and debrief (allow 15 minutes for setup)

### **Group size**

Suited to small groups (6 – 8)

### **Learning objectives**

By the end of the session the learner should be able to:

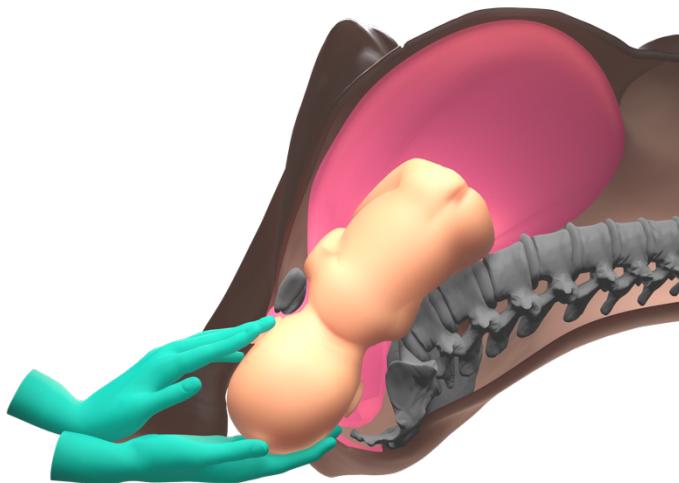

- Identify shoulder dystocia.
- Employ manoeuvres to resolve shoulder dystocia.
- Demonstrate good use of resources and team members.
- Display clear and effective communication skills.

### **Supporting documents**

1. Interactive 3D animation tool
2. PowerPoint (Obcast)
3. List of further readings
4. Shoulder dystocia flow diagram

# Overview

**Shoulder dystocia** is best defined as a vaginal cephalic delivery that requires additional manoeuvres to deliver the fetus after the head has delivered and gentle traction has failed to deliver the after coming shoulders.

Shoulder dystocia (SD) is a relatively uncommon event, with reported incidence around 0.4% - 1.4% of all vaginal deliveries. Almost half of all cases of shoulder dystocia have no indication making it difficult to predict, therefore anticipation and planning are the key to successful management.

In cases where risk factors are identified i.e. previous shoulder dystocia, macrosomia, diabetes, obesity, prolonged first and second stage, augmentation of labour, instrumental birth, a plan needs to be in place for safe and successful management.

After delivery of the fetal head:

- Normal downward traction has failed to deliver the shoulders – excessive downward traction **SHOULD NOT** be performed in order to prevent brachial plexus injury.
- Specific manoeuvres are employed to birth the fetus and minimise risk to both the mother and fetus.

Early detection and a coordinated plan of care for a woman with suspected or diagnosed shoulder dystocia will optimise fetal and maternal outcome, plus minimise associated complications.

**Obstetric emergency** is any clinical situation involving a maternity patient where immediate medical/ midwifery assistance is required.

## Further Readings

[Royal College of Obstetricians and Gynaecologists, Green-top Guideline No. 42, 2nd Edition / March 2012](#)

This Green-top guideline's purpose is to review the current evidence regarding the possible prediction, prevention and management of shoulder dystocia; it does not cover primary prevention of fetal macrosomia associated with gestational diabetes mellitus.

[King Edward Memorial Hospital Obstetric and Gynaecology, Government of WA, Clinical Guideline – Shoulder Dystocia](#)

King Edward Memorial Hospital Obstetric and Gynaecology's clinical guideline on shoulder dystocia.

[Guideline Shoulder Dystocia, The Royal Women's Hospital](#)

The Royal Women's Hospital's (Victoria, Australia) clinical guideline on shoulder dystocia.

# Emergency Management

## Interactive 3D Animation Tool

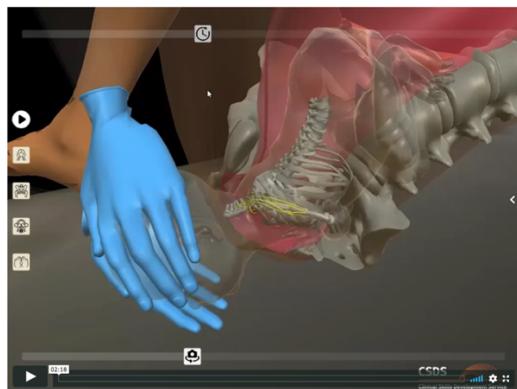

The interactive 3D animation tool was developed to be used as a training aid to teach the mechanisms and manoeuvres of shoulder dystocia.

Access the tool via <https://bit.ly/2Br2gx8>

This interactive animation requires a modern browser capable of running WebGL. To check if your browser supports WebGL, visit <https://get.webgl.org/>.

Below is an introductory video on how to use the interactive 3D animation tool.

# Management of Shoulder Dystocia

Adapted from Algorithm for the Management of Shoulder Dystocia. Royal College of Obstetricians & Gynaecologists. Shoulder Dystocia, Green-top Guideline No.42, March 2012, Appendix 2.

Baby reviewed by Neonatal Team. Document all actions and complete a clinical incident report

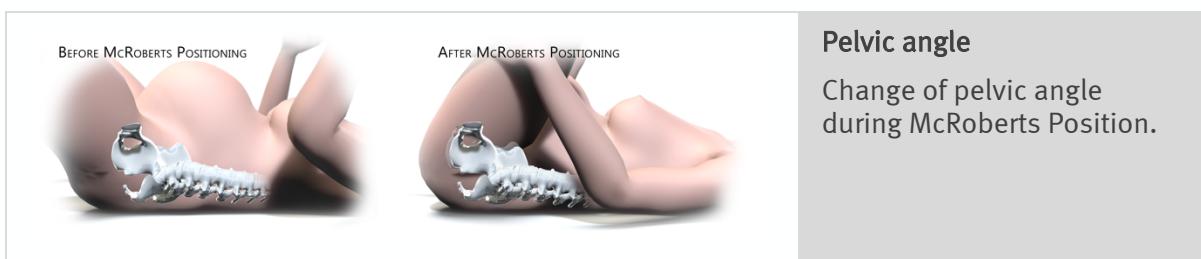

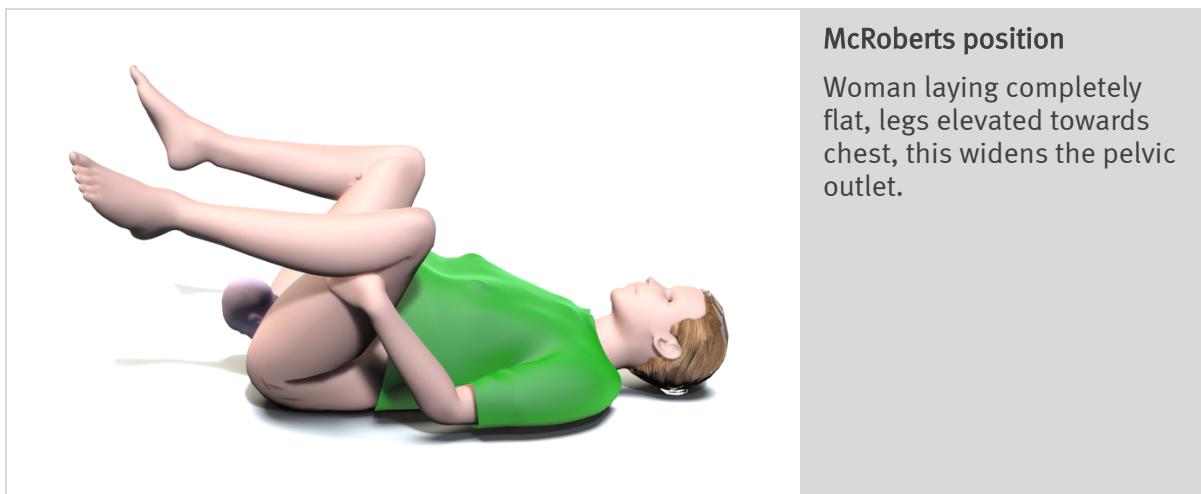

Debrief patient, support people and staff

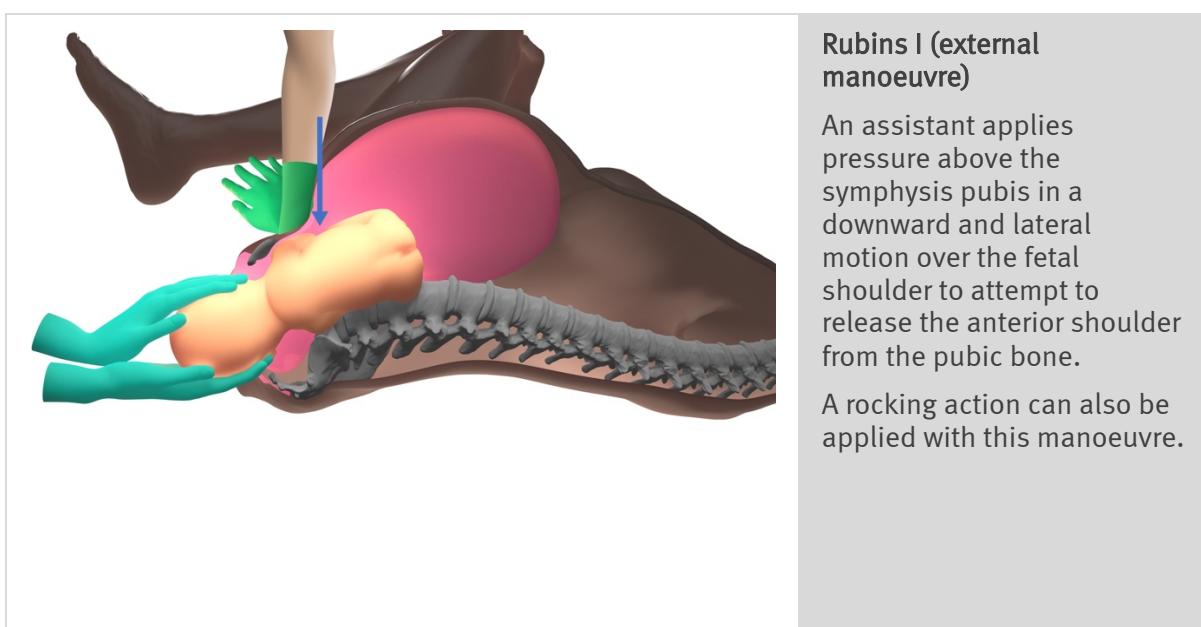

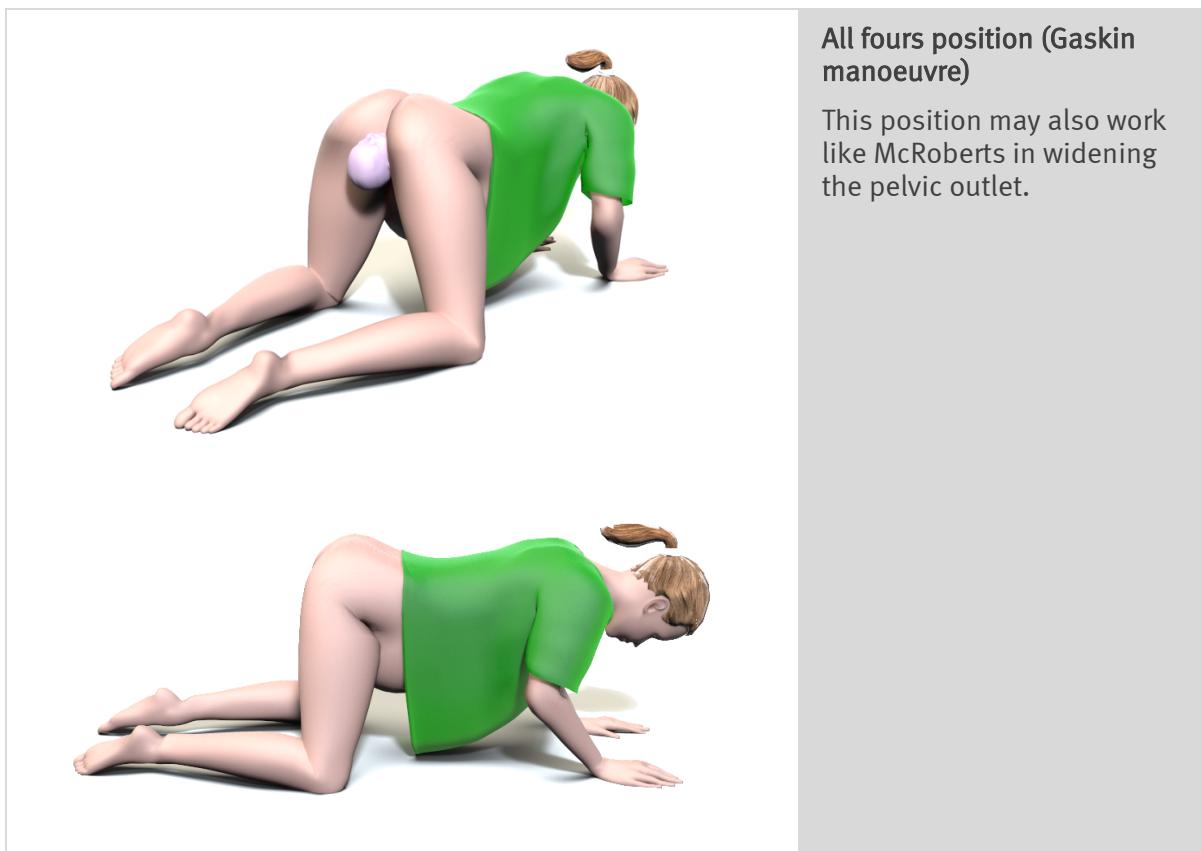

# Specific Management

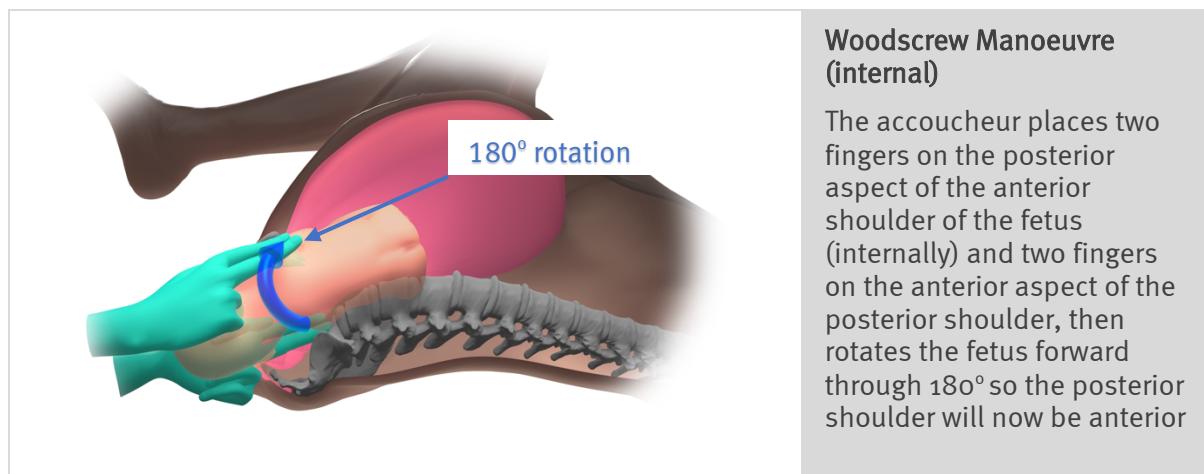

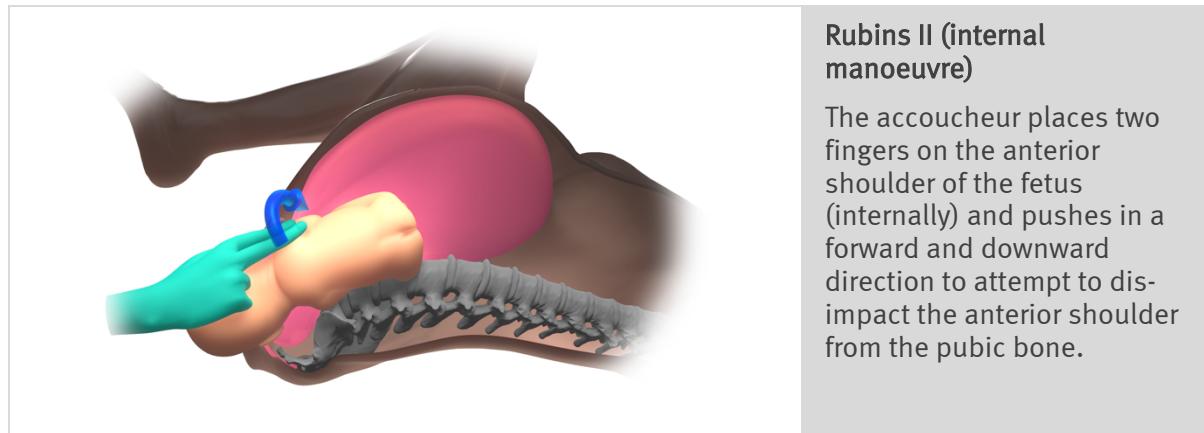

The following diagrams depict the different manoeuvres used to elevate shoulder dystocia. Some of the treatments are external and some involve internal manoeuvres. They are listed with external manoeuvres first followed by internal manoeuvres, the order of management is the decision of the clinician and **does not have to follow order**.

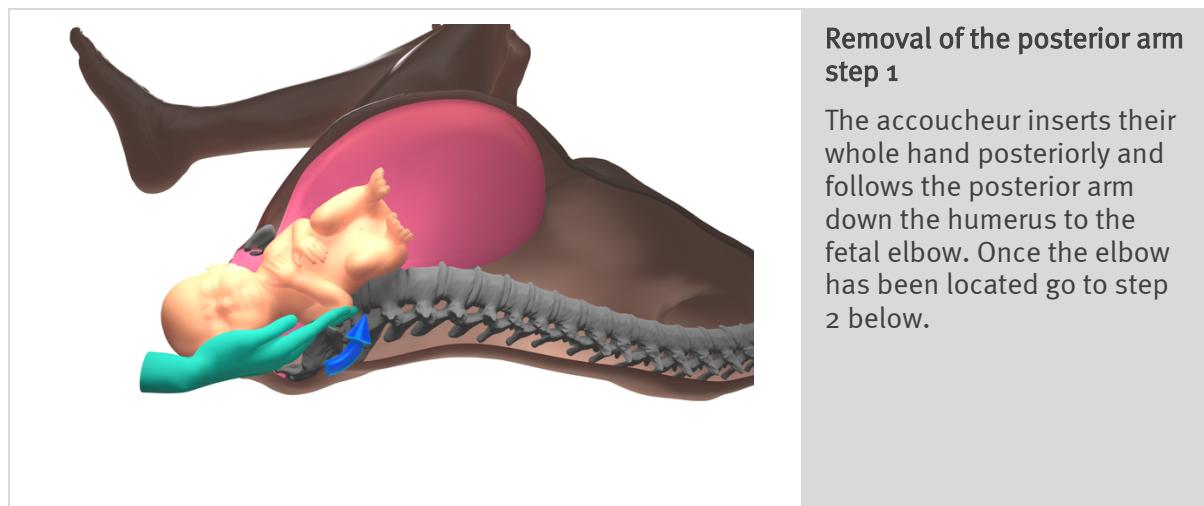

## External manoeuvres

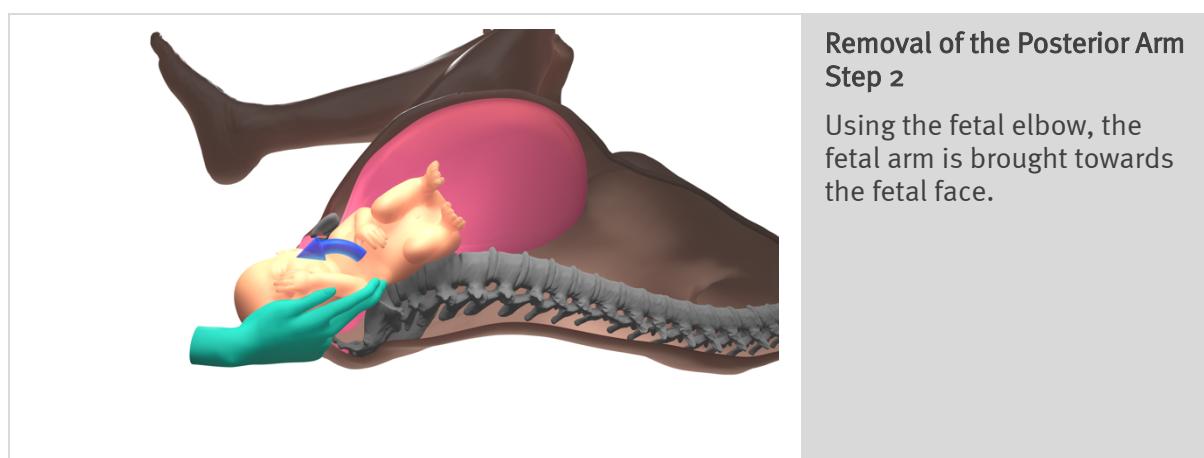

## Internal manoeuvres

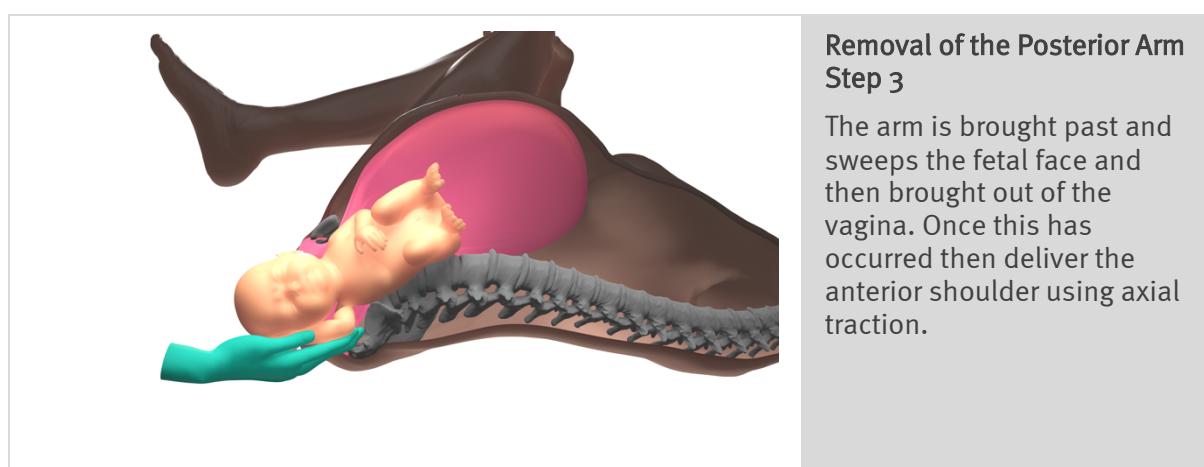

**Removal of the posterior arm  
step 1**

The accoucheur inserts their whole hand posteriorly and follows the posterior arm down the humerus to the fetal elbow. Once the elbow has been located go to step 2 below.

**Removal of the Posterior Arm  
Step 2**

Using the fetal elbow, the fetal arm is brought towards the fetal face.

**Removal of the Posterior Arm  
Step 3**

The arm is brought past and sweeps the fetal face and then brought out of the vagina. Once this has occurred then deliver the anterior shoulder using axial traction.
